Here we report results of the simulations when dominant markers were generated an analysed using SNAPP, with and without the correction for dominance.

| 1000000 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | |

Table S1: The size of the credibility sets in the first simulation when dominant markers were simulated but SNAPP was used *without* the dominant marker correction. Here, 'tree' indicates which of the trees in Fig. ?? was used to generate data. 'c' and 'i' indicate whether 'correct' or 'incorrect' priors were used on the θ values and on the speciation rate. Numbers 100 to 1000000 indicate the number of polymorphic sites generated. Values in the table are the numbers of trees in the credibility set. The seven instances where the true tree was not contained within this set are marked by an asterix (*).
